CROSSPCAI · THE ENGINE INSIDE SYREBRUM

Every PC you own, working as one AI team.

CrossPCAI connects your office PC, your laptop and your Linux server into one fleet. Tasks go to the machine that can do them, your AIs work across all of them, and one button stops everything.

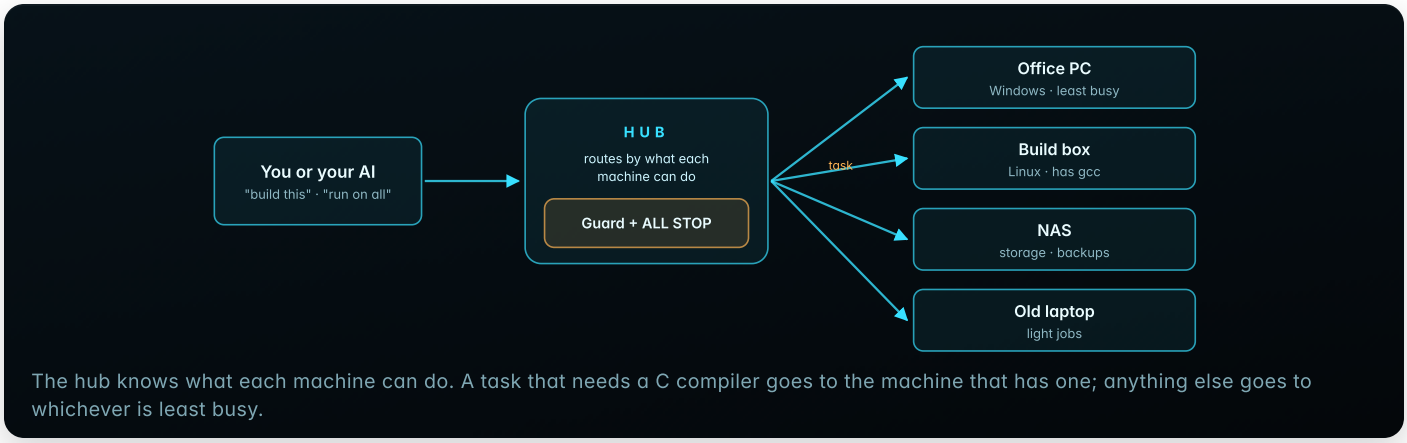

● **Public releases since Sep 2026** · ships inside the Syrebrum installer

THE PROBLEM

Most AI tools work on one computer, or in someone else's cloud. A business usually has several machines and some software or data that can't leave the building. Using AI across them takes scripts, remote-desktop tools and a person to stitch it together.

WHAT CROSSPCAI DOES

One installer goes on every machine. The first run picks its role, and the hub hands each task to the machine that has what the task needs. Your AI works with the whole fleet, on your own hardware.

The hub knows what each machine can do. A task that needs a C compiler goes to the machine that has one; anything else goes to whichever is least busy.

01 What you get

One download
A Windows Setup.exe with Syrebrum built in, and a Linux .deb. Updates install only if signed with CCD's release key.

History that holds up
Every task keeps its attempts. A retry is a new attempt, liveness is tracked by leases, and only safe tasks retry on their own.

Bring any AI
13 AI provider adapters, including Anthropic, OpenAI-compatible, Gemini and Meta. One command points about 10 AI tools at your fleet.

Guard
Unknown agents are read-only. Risky actions wait for a person, and no answer means no. Every decision lands in a signed audit log.

Routing by capability
A task can require a tool only one machine has, or fan out to every machine and return one result each.

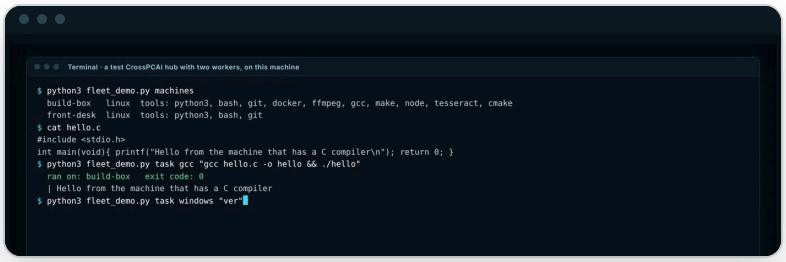

Screen sharing and control
See and control another PC from your desk: Windows to Linux and Windows to Windows.

Health, throttle and ALL STOP
Every PC reports CPU, memory and disk. The hub tells agents to go, slow down or pause, and ALL STOP halts every task on every PC.

Your network, your rules
Connect anywhere, LAN-only, Syrebrum Mesh or your own Tailscale. Use local models so work never leaves your machines.

CROSSPCAI · IN PRACTICE

Put the old machines back to work.

Real hub and workers on a test machine: a task that needs gcc runs on the worker that has it.

02 Who it's for

Offices with 2+ PCs	Including ones with Linux software they can't replace.
Developers	Coding agents running on several machines, with per-folder permissions.
Homelabs	Windows, Ubuntu, Debian and TrueNAS machines as workers.

03 Works with

Command center	Windows 10 and 11
Workers	Windows, Ubuntu, Debian, TrueNAS
Agent doors	An MCP server and an A2A endpoint, both behind the same policy, approvals and audit trail
Local AI	Ollama and other local models

04 How to get it

CrossPCAI comes inside every Syrebrum plan. One licence key covers every machine in the plan.

Basic	$29.99/mo · 1 PC
Pro	$49.99/mo · 3 PCs
Premier	$99.99/mo · 5 PCs
More PCs	Larger fleets: ask us

05 See it in action
