SYREBRUM

PRODUCT BROCHURE

FAILSTOP · AGENT GOVERNANCE

A kill switch and proof for every AI agent.

AI agents now run commands, send messages and change records. Failstop lets you stop them in one step, makes risky actions wait for a person, and keeps signed proof of every decision.

- **Running as the gate in front of CCD's own AI connectors** · licensed add-on

THE PROBLEM

Most organizations can't stop a misbehaving agent quickly, or prove afterwards what it did and who approved it. Teams with strict requirements need that control and that evidence before they let agents in.

WHAT FAILSTOP DOES

Every agent action passes a kill switch, hard rules and a risk score. The result is allow, hold for a person, or kill, and every decision becomes a signed receipt anyone can check. It works under any AI vendor.

Failstop judges behavior, never intent. One odd event stays low; several signals lining up on the same agent push it to a hold or a kill.

01 What you get

Kill switch
Stop every running process for one task, one agent, one machine or the whole fleet. Pending approvals in scope are cancelled.

Behavior scoring
Five independent signal families (rules, baseline, rate, tamper and drift) combine into one per-agent risk score that fades over time.

Connector gate
AI connector calls may draft but never confirm a decision, and may not write secret-shaped text. Failstop sees structure, not your record text.

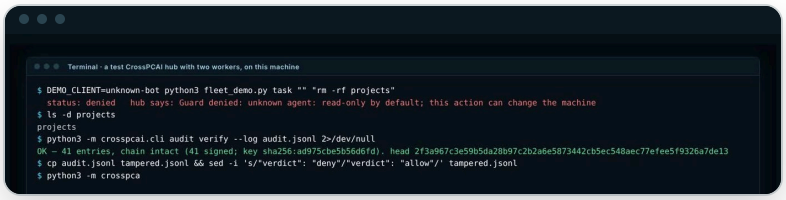

Approvals that mean it
Risky actions are held for a person, by phone. No answer means deny, and an agent can never approve its own request.

Signed receipts
Every entry is hash-chained and signed with Ed25519. The verifier names the first entry that was altered.

Secret shield
Credentials are scrubbed from results and logs. Agents use secrets by reference, resolved only on the machine that runs the command.

FAILSTOP · IN PRACTICE

Prove it, don't promise it.

Real commands on a test hub: Guard refuses a delete from an unknown agent, and the signed audit log verifies.

02 Who it's for

Strict requirements	Organizations that must show who approved what: public sector, healthcare, finance.
Proprietary data	Companies that can't let an agent act without a record and a stop button.
AI-security teams	A vendor-neutral proof layer under any AI.

03 Where it runs

In Syrebrum	On the machines that already run Syrebrum and CrossPCAI. It adds scoring and receipts to paths that already pass through Guard.
In front of Ops	As the gate on a self-hosted Syrebrum Ops.
On-premises	Including offline sites. Signing keys live in the operating system's keychain.

04 Good to know

Failstop produces the kind of evidence compliance programs ask for: audit trails, human approval records and kill-switch logs. Failstop itself is not certified under any compliance program.
