SYREBRUM MESH

A private network for your business, with no IT person.

Your shop PC, home laptop, server and phone reach each other securely, from anywhere. Each customer gets their own isolated control server. There are no ports to open and no VPN box to buy.

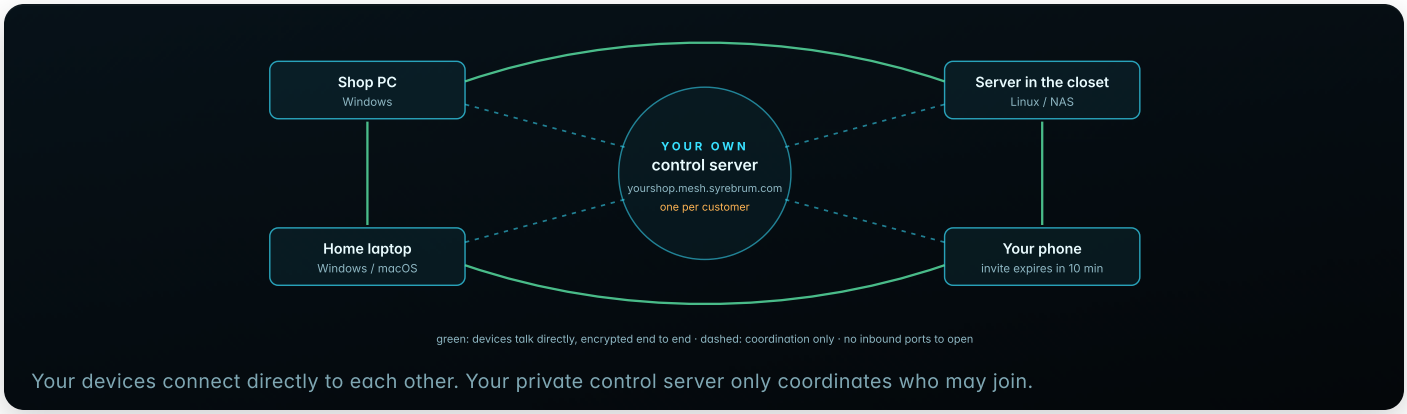

● **Running on CCD's own machines since Oct 2026** · customer onboarding in beta

THE PROBLEM

A PC at the shop, a laptop at home and a server in a closet should work together. Usually that means port forwarding, a VPN appliance or a consultant. Shared VPN services put many customers on one control plane, and a second VPN can collide with one you already run.

WHAT MESH DOES

Syrebrum Mesh links your machines into one private network built on open-source Tailscale clients and Headscale, with a control server that belongs to you alone. Syrebrum, its workers and the phone app use it to reach each other across buildings.

Your devices connect directly to each other. Your private control server only coordinates who may join.

01 What you get

Your own control server
One isolated server per customer, with its own network, keys, database and certificate, at yourshop.mesh.syrebrum.com.

Works alongside Tailscale
Each Syrebrum PC joins in userspace mode: no admin rights, no network driver, and it never touches a Tailscale install you already have.

Watched for you
New devices raise an urgent alert. Server health and certificate expiry are checked every minute, ports hourly, with nightly backups.

Safety fixed in code
Devices join with DNS takeover and route takeover switched off, so even a hijacked control server can't redirect traffic.

Invites that expire
One-time join invites expire after 10 minutes, with roles for machines, phones, members and admins. People's devices expire after 90 days.

In the one installer
Client built from source for Windows, macOS and Linux, on x64 and ARM, inside the same Syrebrum download.

SYREBRUM MESH · YOUR CHOICE

Connect the way you want.

LAN ONLY

Stay in the building

- Everything stays on your office network
- Leave the mesh off entirely

MOST SHOPS

FLEET MESH

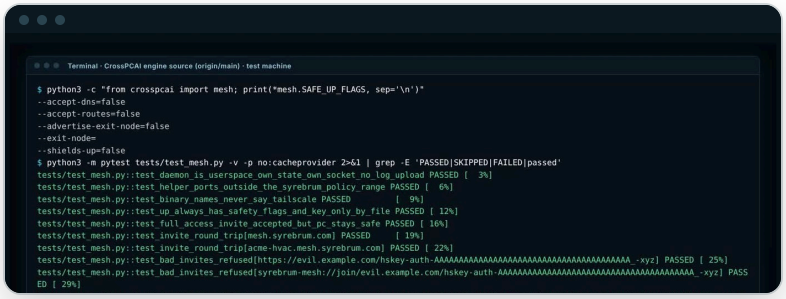

Link your machines

- Syrebrum PCs, workers and your phone reach each other from anywhere
- Only Syrebrum's own connections use it

FULL VPN

Shares and printers

- Office file shares and printers through a gateway device
- Opt-in add-on

Real output on a test machine: the fixed join flags, then the mesh test suite passing.

02 Who it's for

Multi-site shops	More than one building, remote PCs or a home office.
Any business	A private, single-tenant mesh VPN on its own, as a standalone service.
IT providers	The client already supports an allow-list of provider-run mesh servers.

03 How to get it

Comes with every Syrebrum plan for linking your own PCs. Standalone service and Full VPN add-on: ask us.

04 Built-in controls

Approve, revoke, restore
Approve a device, revoke one, revoke every key at once, or restore from a backup. Every operator action is audited.

Tighter on Windows
Syrebrum's Windows build restricts the mesh control pipe to the owner and the system account, narrower than the stock client.

No exit nodes on our servers
Exit nodes never run on CCD's servers, so your internet traffic never leaves through us.
